Bevindingen over depressie en het verouderende brein via PET/MR beeldvorming

Depressie en het verouderende brein: intro

- Lower hippocampal volume
- Smaller amygdala
- Larger lateral ventricles

1. Han et al., Molecular Psychiatry 2020
2. Enigma study

Depressie en het verouderende brein: intro

- **Lower hippocampal volume**
- Smaller amygdala
- Larger lateral ventricles

- **TAU**
- **AMYLOID**
- **SD**

1. Han et al., Molecular Psychiatry 2020
2. Enigma study

Depressie en het verouderende brein: intro

PET MR

- Lower hippocampal volume
- Smaller amygdala
- Larger lateral ventricles

- TAU : ^{18}F -MK-6240
- AMYLOID : ^{18}F -FLUT
- SD: ^{11}C -UCB-J

1. Han et al., Molecular Psychiatry 2020

Demografische kenmerken

	LLD	CON	MCI	Statistical value	P-value
Number	10	50	20	/	/
Age (mean, sd)	72.8 (6.4)	69.5 (7.7)	70.1 (7.1)	U=295	p=0.38
Female (%)	70%	46%	60%	/	p=0.30
ApoE4 carrier (%)	20%	17%	65%	/	p=0.67
Amyloid Pos	1 (10%)	10 (20%)	95%	/	p=0.67
MMSE (mean, sd)	26.7 (2.4)	29.2 (1.1)	24.5 (2.2)	U=495.5	*<0.001
GDS (mean, sd)	20.4 (7.0)	2.8 (2.8)	8.35 (6.5)	U=66.5	*<0.001

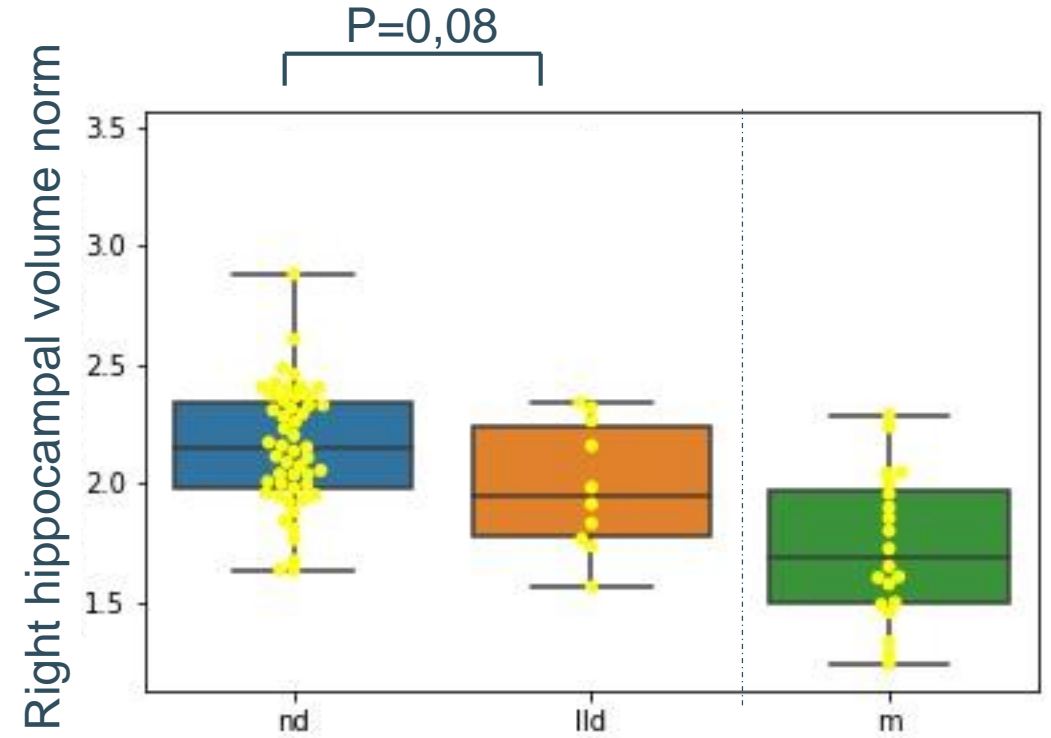

Klinisch verschillende groepen

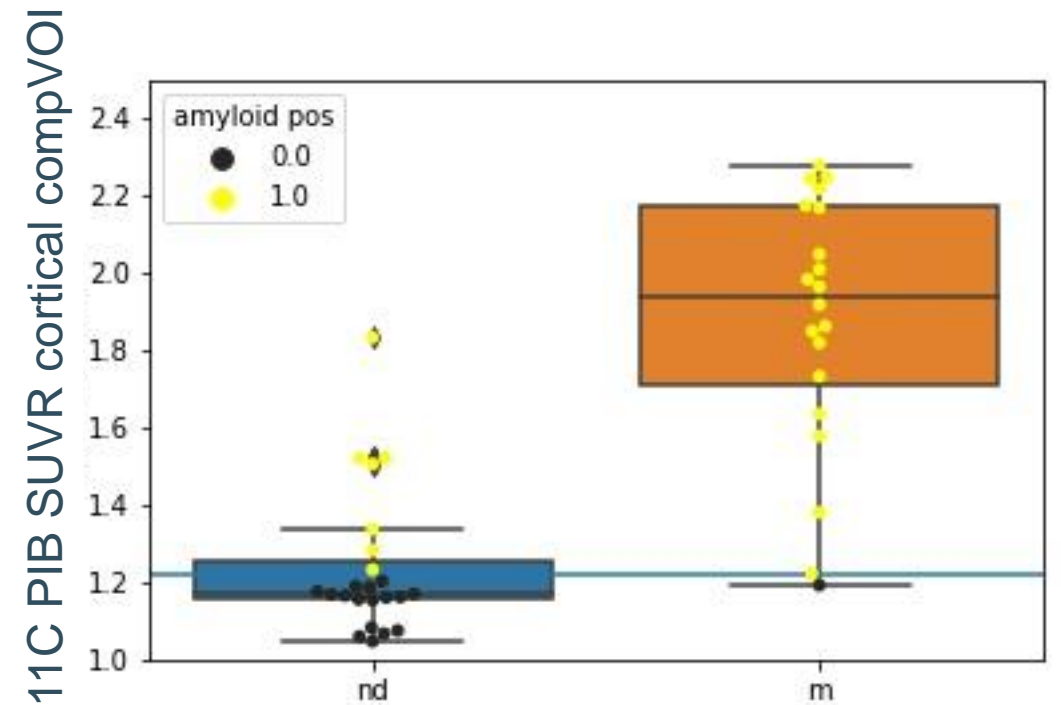

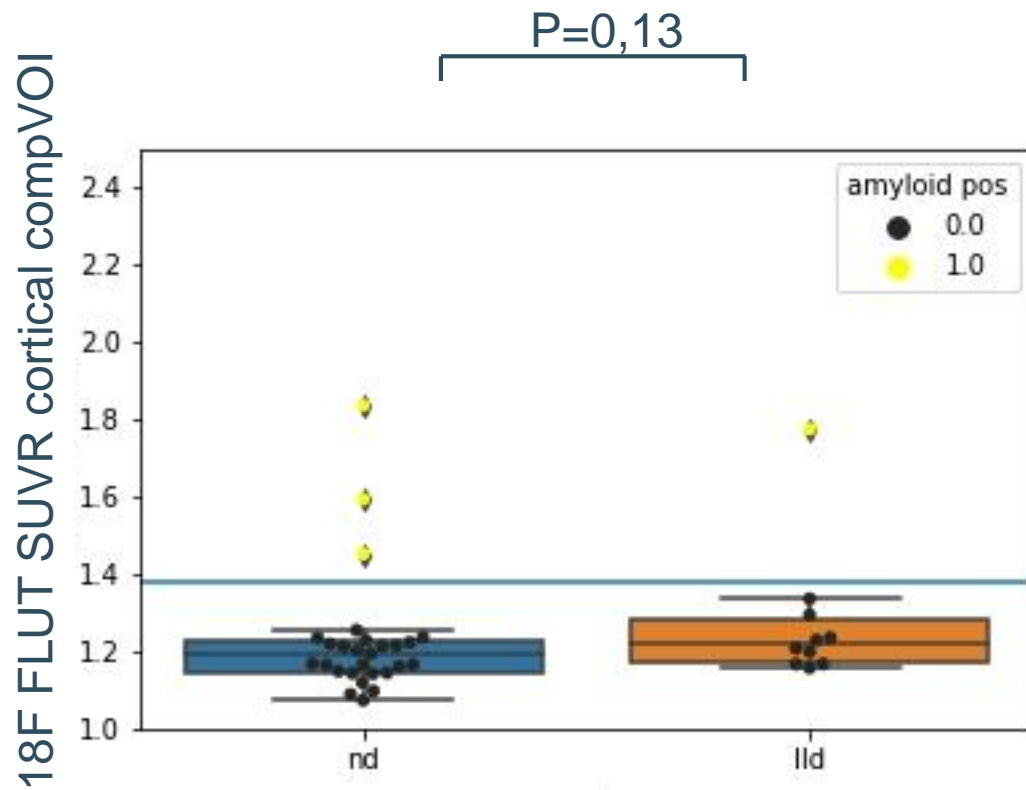

Apathie is hoger bij A β -positieve controles

Verschillen in hippocampaal volume

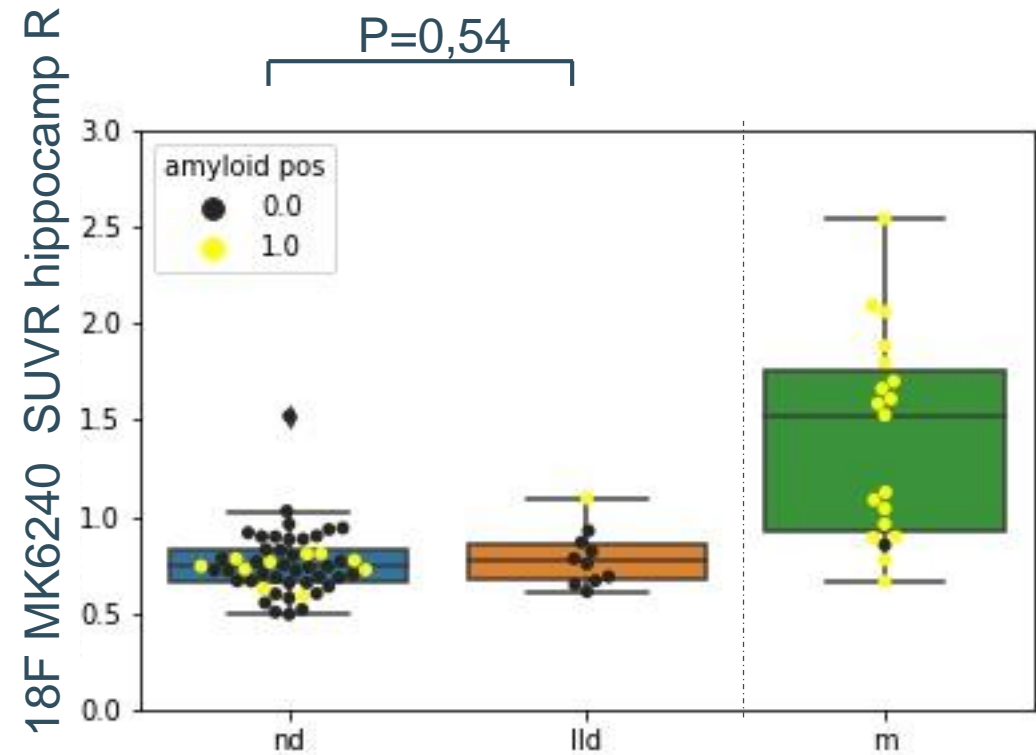

Corticale amyloid neerslag

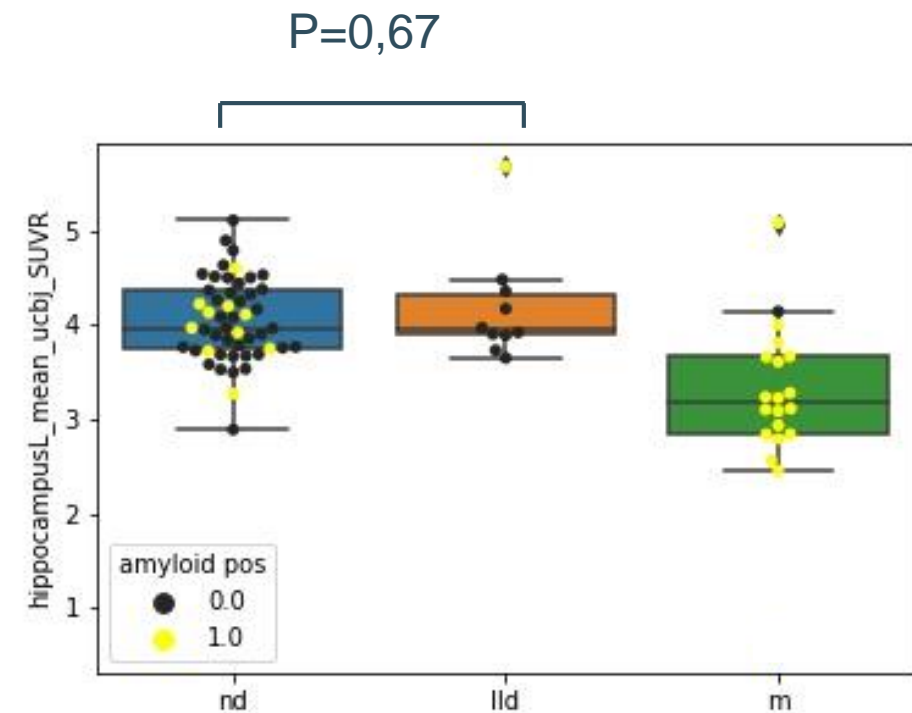

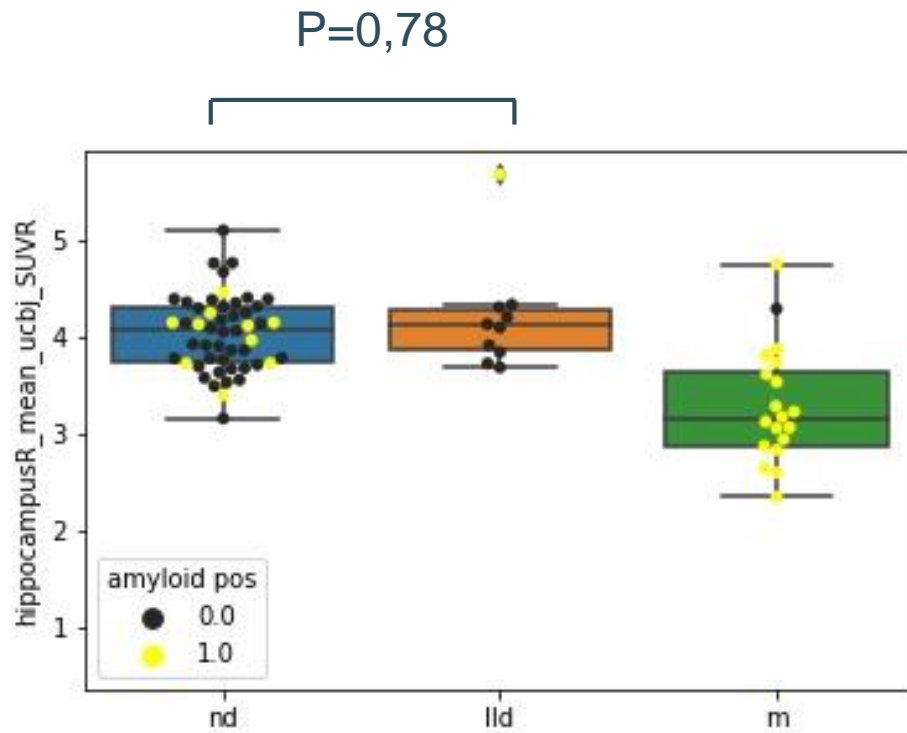

Corticale subthreshold amyloid neerslag

Geen verschil in hippocampale tau neerslag

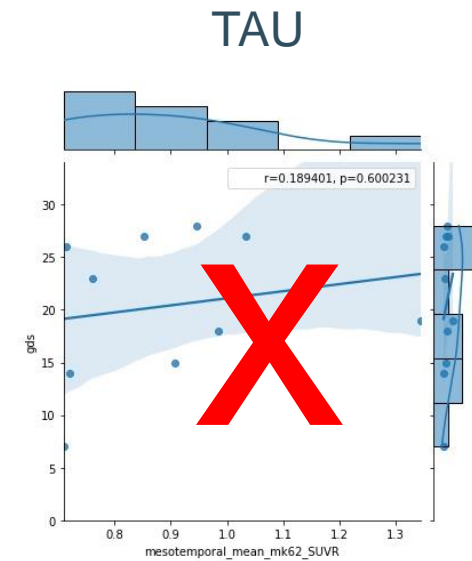

Geen verschil in hippocampale synaptische densiteit

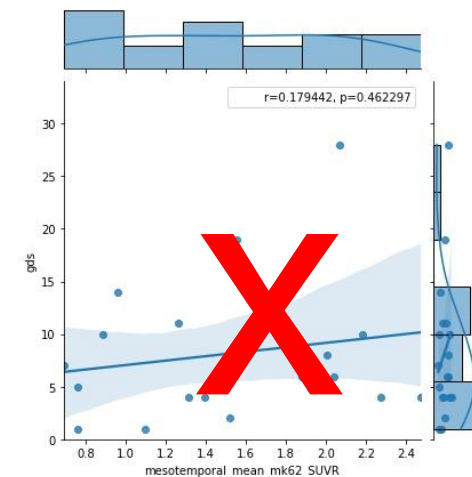

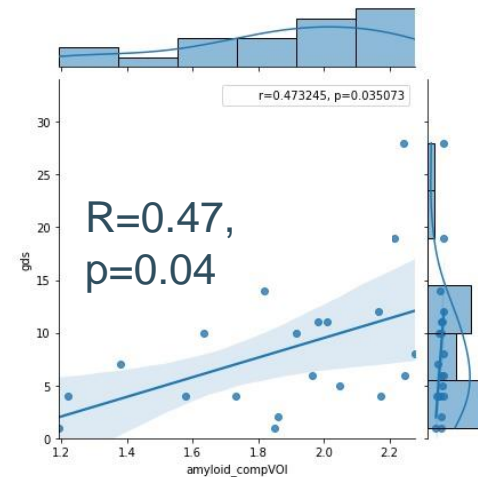

GDS correleert met amyloid neerslag in MCI, niet met tau

LLD

MCI

Samenvatting

- Geen significant verschil in:
 - Hippocampaal volume ($\sim p=0.14$)
 - Corticale amyloid neerslag ($\sim p=0.13$)
 - Hippocampale tau neerslag ($\sim p=0.30$)
 - Hippocampale synaptische densiteit ($\sim p=0.70$)
- GDS correleert met amyloid (niet met tau) in MCI (niet in LLD)

Psychomotore dysfunctie in depressie: een onderzoeksveld in beweging

Psychomotore dysfunctie (PMD)

Psycho = gerelateerd aan psychiatrische ziekte

Motore= betreft de motoriek

Dysfunctie = het werkt “niet goed”

PMD in 20(-60%) MDD³ en ↑ leeftijd⁵

PMD responsief op TCA en ECT⁴... maar PD ook

³ Calligiuri et al. 2000; ⁴Reijnders et al. Mov dis 2008, ⁵Rogers et al. 2002

Table 1
Overview of the psychomotor assessment techniques employed and main research purposes of the studies reviewed

Type of assessment	Number of studies	Main research purposes			
<i>1. Observer-rated assessments</i>			<i>2. Gross motor activity</i>		
Clinical evaluation	1	Diagnosis	Wrist actometer	9	Study of young patients, measurement, treatment effect, pathophysiology
Single-item observation					
-Hamilton Depression Rating Scale	17	Pathophysiology, predictive capacity, daily-life activity	Belt-worn actometer	2	Study in children, measurement
			Movement analysis of gait	5	Measurement, treatment effect, daily life activity
			Movement-pattern analysis (based on video-tape interview)	1	Diagnosis, pathophysiology
			Wrist rotation approach	2	Measurement, predictive capacity
			<i>3. Fine motor activity: digitizer</i>		
-Diagnostic interview	1	Study of young patients (preschool-age)	Copying tasks (lines, simple and complex figures)	5	Treatment effect, measurement, diagnosis,
Psychomotor rating scale			Fitts' task	5	Diagnosis, measurement, treatment effect, pathophysiology
-Salpêtrière Retardation Scale	12	Validity, treatment effect, pathophysiology, measurement, diagnosis	Symbol Digit Substitution Task	3	Diagnosis, pathophysiology
			Sentence writing and drawing superimposed concentric circles	3	Treatment effect, measurement
-CORE Assessment of Psychomotor Change	6	Validity, pathophysiology, predictive capacity, diagnosis	<i>4. Speech analysis</i>		
-Motor Agitation and Retardation scale	2	Validity, treatment effect		3	Measurement, prognosis

Schrijvers et al. 2008.

Beeldvorming PMD

- **Structureel (CT/MRI)**

Ventrikeldilatatie

Atrofie suppl. motor cortex, prefrontale cortex, basale ganglia

Witte stofletsels (WML) frontostriataal en paralimbisch

- **Metabool** (Perfusie-, FDG-, RTI-32- and ^{18}F -DOPA - PET/ $^{99\text{m}}\text{Tc}$ - and ^{123}I -IBZM- SPECT/ ASL)

Hyper/hypofunctie in frontostriataal circuit/basale ganglia, prefrontale kwab, cinguli

- **Functioneel** (fMRI, EEG)

Gedaalde FA in VTA – frontale kwab connecties in fMRI

Hersenbrekers...

- PMD meting:
 - subjectief (schalen) vs objectief (instrumentele taken)
 - contributie stemming, motivatie en cognitie op meting
- PMD neuro beeldvorming: waar en wat? modaliteit? RDoC?
- PMD respons op ECT: hoe?

Motorisch assessment in L3D studie

Imaging: MRI & PET

MRI sequences

- **T1**
- **T2 Cube + T2 High Resolution (hippocampus)**
- **FLAIR**
- ASL (Tissue perfusion)
- SWAN (blood vessels, iron)
- DTI (tractography)
- rsMRI (DMN – ACC en pFC)

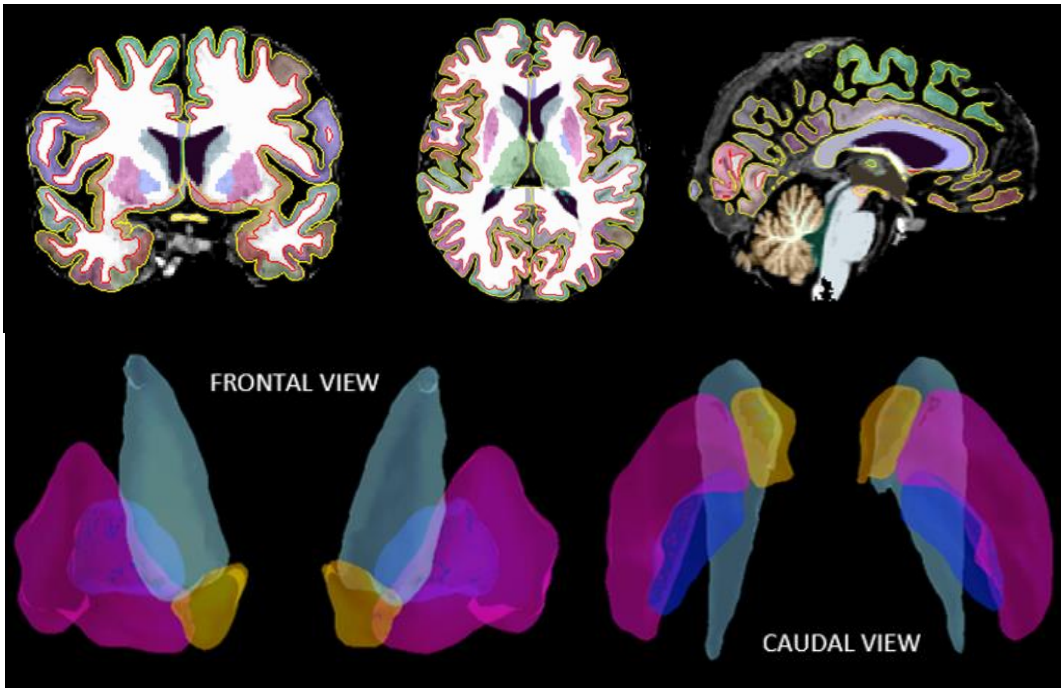

PET modalities

- **UCB-J (11C) $T_{1/2}$ 20 min**
Target: SV2A (synaptic density)
- MK-6240 (18F) $T_{1/2}$ 110 min.
Target: Tau (NF tangles)
- Flutemetamol (18F) $T_{1/2}$ 110 min.
Target: β -Amyloïd (plaques)

PMD neurobiologie: MRI

- Volumetrie vs shape analyse vs VBM
 - WML quantificatie: Fazekas vs automated vs semi-automated
 - WM integriteit analyse: DTI/tractografie → hubs vs connecties
 - ...
- Statistisch design met controle voor leeftijd, geslacht, cognitie en stemming = sufficiënte sample size (power analyse)!

Surface area (bilateral)

Conclusie neurobiologie van PMD

1. Meten van PMD:

- Objectieve technieken (tablet, 24u-actimetrie)
- Sample size toename → controle voor cognitie, stemming, apathie

2. Beeldvorming hersenen bij PMD:

- hybride modaliteiten

3. Neuroplasticiteit basale ganglia bij ECT ?

Neurobiologische effecten van ECT bij depressie op latere leeftijd

Wat zegt de literatuur?

ECT

- Grijsz stof toename
- Functionele connectiviteit
- Neurotrofe factoren
- Cytokines
- Metabolites
- Gen expressie

ECS

- Neuroplasticiteit
- synaptogenese
- Angiogenese
- Gen expressie
- Cytokines
- Neurotrofe factoren

Wat zegt de literatuur?

ECT

- Grijze stof toename

Besluit

Behavioral and neural correlates of the positivity effect in late-life depression

What's fMRI?

- functional Magnetic Resonance Image (fMRI)
- Blood-Oxygen-Level-Dependent (BOLD) signal
- Correlation, not Causation

Socioemotional Selectivity Theory (SST)

- When time horizon is perceived as limited, people tend to focus on things benefiting well-being (Carstensen et al., 1999).
- Elder adults tend to attend to positive stimuli and adopt emotion regulation strategies automatically when facing negative events (Mather, 2012).
- Increased engagement of emotion-regulation brain regions in elderly

ng
stimulus
stimulus

8s

fMRI

Chill Band+

- Skin Conductance
- Skin Temperature
- Acceleration (ACC)

Ecological Momentary Assessment (EMA)

- Past Stress
- Current Stress
- Social Stress
- Positive Affect
- Negative Affect
- Interoception

EMA questionnaire

Blok 1: Negatief affect

- Net voor het alarm voelde ik mij onzeker
- Net voor het alarm voelde ik mij angstig
- Net voor het alarm voelde ik mij neerslachtig
- Net voor het alarm voelde ik mij schuldig
- Net voor het alarm voelde ik mij eenzaam

Blok 2: Positief affect

- Net voor het alarm voelde ik mij opgewekt
- Net voor het alarm voelde ik mij ontspannen
- Net voor het alarm voelde ik mij tevreden

Blok 3: Stress:

- Denk aan de belangrijkste gebeurtenis die is voorgevallen sinds de vorige rapportering. Hoe aangenaam was deze gebeurtenis?
- Hoeveel stress had u op het moment dat het alarm afging?

Blok 4: Sociale context

- Met wie ben ik op dit moment?
- Ik vind dit gezelschap aangenaam
- Ik zou liever alleen zijn op dit moment
- Ik vind het aangenaam om alleen te zijn op dit moment
- Ik zou liever in het gezelschap van anderen zijn op dit moment

Blok 5: Interoceptie

- Beschrijf op een schaal van 1 tot 10 hoe sterk u interne prikkels op dit eigenste moment ervaart

Demography

- 26 Healthy Control
 - 14 Female, 12 Male
 - Age: 60 – 88 (mean: 70.23; SD: 6.483)

Associations between EMA and ChillBand

SC: skin conductance; ST: skin temperature; ACC: accelerometer signal.

Mood Rating

17 subjects

- 11 female
- 6 male

Age: 62 – 88

- Mean: 71.53
- SD: 6.938

1: Negative

10: Positive

Rating	N = 17	Before	After	Difference	p value
Negative		6.686	5.174	-1.512	0.027 ^{a**}
Neutral		6.216	6.563	0.347	.573
Positive		6.661	7.904	1.243	0.009 ^{a**}

a: Wilcoxon Signed Ranks Test

Inter-Subject Correlation (ISC)

- Hasson et al. (2004)
- Complex and continuous situations
 - Social interaction
 - Narrative comprehension
 - Movie clips

Nastase et al. (2019)

Negative > Neutral

- The right Orbital Frontal Cortex
- The Posterior Cingulate Cortex (PCC)

FDR, $q = 0.05$

Positive > Negative

- The ACC, right dlPFC
- The right dmPFC, vmPFC

Positive > Neutral

- The right vmPFC
- The dmPFC, ACC, PCC

FDR, $q = 0.05$

Planned analyses

- Investigate group effects
- Link EMA and ChillBand data with brain activation
